hello, world

```
1 /* file: helloworld.c */
2
3 #include <stdio.h>
4
5 int main() {
6     printf("hello, world\n");
7     return 0;
8 }
```

```
$ gcc -o helloworld helloworld.c
$ ./helloworld
hello, world
```

global variables

```
1 // file: figure2-4.c
2 // Stan Warford
3 // A nonsense program to illustrate global variables
4
5 #include <stdio.h>
6
7 char ch;
8 int j;
9
10 int main() {
11     scanf("%c %d", &ch, &j);
12     j += 5;
13     ch++;
14     printf("%c\n%d\n", ch, j);
15     return 0;
16 }
```

```
$ gcc -o figure2-4 figure2-4.c
$ ./figure2-4
M 419
N
424
```

program breakdown

```
5  #include <stdio.h>
6
7  char ch;
8  int j;
9
10 int main() { <-----
11     scanf("%c %d", &ch, &j);
12     j += 5;
13     ch++;
14     printf("%c\n%d\n", ch, j);
15     return 0; <-----
16 }
```

C programs ALWAYS
start execution with
the `main` function

returning from `main`
ends the program

program breakdown

global variables are
declared here —
outside of any function

characters in C are
treated internally
like signed integers

```
5  #include <stdio.h>
6
7  { char ch;
8    int j;
9
10 int main() {
11     scanf("%c %d", &ch, &j);
12     j += 5;
13     ch++;
14     printf("%c\n%d\n", ch, j);
15     return 0;
16 }
```

program breakdown

read data from
stdin (the terminal)

print data to **stdout**
(the terminal)

```
5  #include <stdio.h>
6
7  char ch;
8  int j;
9
10 int main() {
11     scanf("%c %d", &ch, &j);
12     j += 5;
13     ch++;
14     printf("%c\n%d\n", ch, j);
15     return 0;
16 }
```

correct headers must
be included to access
library functions

scanf and **printf** are
both library functions
declared in **stdio.h**

program breakdown

```
5  #include <stdio.h>
6
7  char ch;
8  int j;
9
10 int main() {
11     scanf("%c %d", &ch, &j); <---
12     j += 5;
13     ch++;
14     printf("%c\n%d\n", ch, j);
15     return 0;
16 }
```

& is the address of operator — **scanf** expects the address of the variables where the data will be stored

conditions

```
1  if (<cond>) {  
2      /* ... */  
3  }  
4  else (<cond>) {  
5      /* ... */  
6  }  
7  else {  
8      /* ... */  
9  }
```

conditions

```
1  if (x) {  
2      /* ??? */  
3  }  
4  if (x-y) {  
5      /* ??? */  
6  }  
7  if (x=y) {  
8      /* ??? */  
9  }
```

- under what conditions will each of the above be executed?

switch

```
1  switch (<expr>) {  
2      case <const>:  
3          /* ... */  
4  
5      case <const>: /* fall-through */  
6          /* ... */  
7      break;  
8  
9      default:  
10         /* ... */  
11         break;  
12 }
```

loops

```
1  for (<init>; <cond>; <incr>) {  
2      /* ... */  
3  }  
4  
5  while (<cond>)  
6      /* ... */  
7  }  
8  
9  do {  
10     /* ... */  
11 } while (<cond>);
```

memory model — part i

global variables

declared outside of any function and remain in place throughout the execution of the entire program. they are stored at a fixed location in memory.

local variables

declared within a function and come into existence when the function is called and cease to exist when the function terminates. they are stored on the run-time stack.

(a) Fixed location.

(b) Run-time stack.

run-time stack a.k.a. “the stack”

run-time stack

stores information about the active functions of a C program, including:

- return value,
- parameters,
- return address, and
- local variables

in that order.

run-time stack a.k.a. “the stack”

run-time stack

stores information about the active functions of a C program, including:

- return value,
- parameters,
- return address, and
- local variables

in that order.

(a)

(b)

functions

comparison

Java	C
object-oriented	procedural
interpreted	compiled
String	char array
condition (boolean)	condition (int)
garbage-collected	no memory management
references	pointers
exceptions	error codes
